3. Project Design Phase

Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

Project Phase Document

System Design Overview

The design defines how a standard laptop request moves from submission and approval through automated task preparation and Hardware assignment.

Workflow Design

User Request → Approval → Flow Trigger/Condition → Update Short Description → Assign to Hardware Group → Task Ready for Hardware Processing → Completion.

Flow Components

- Flow name: Standard laptop task
- Application: Global
- Run As: System User, as configured for the project
- Approval/process condition
- Record update action
- Assignment group update action

Architecture

User interacts with ServiceNow. The ServiceNow request/approval process provides the input state. Flow Designer evaluates the configured condition and performs the required record updates. The Hardware assignment group receives the resulting task.

Design Considerations

- Use clear and meaningful action names.
- Keep the flow limited to the required procurement process.
- Verify field values before final execution.
- Capture screenshots of important configuration and execution stages.
